Business Analytics Dashboard v1

Dashboard publication, heuristic review and revision plan

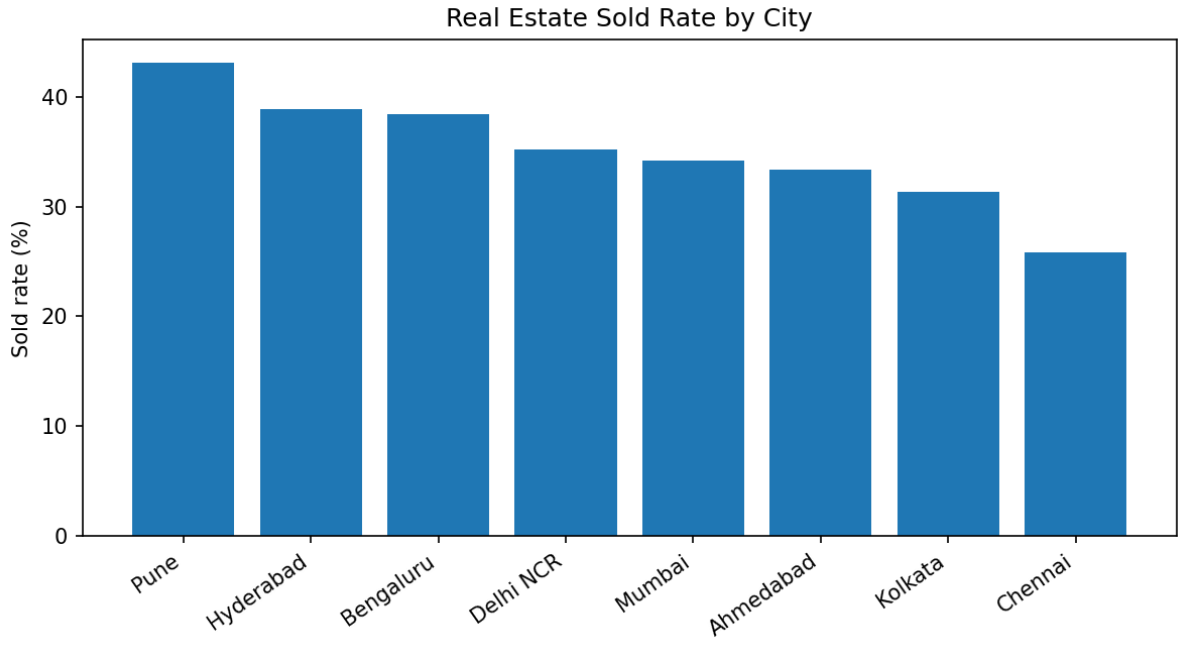

Objective. Deliver a first dashboard version covering all KPIs available across the supplied real estate, customer, and product datasets. Document heuristic feedback and define a prioritized v2 revision list.

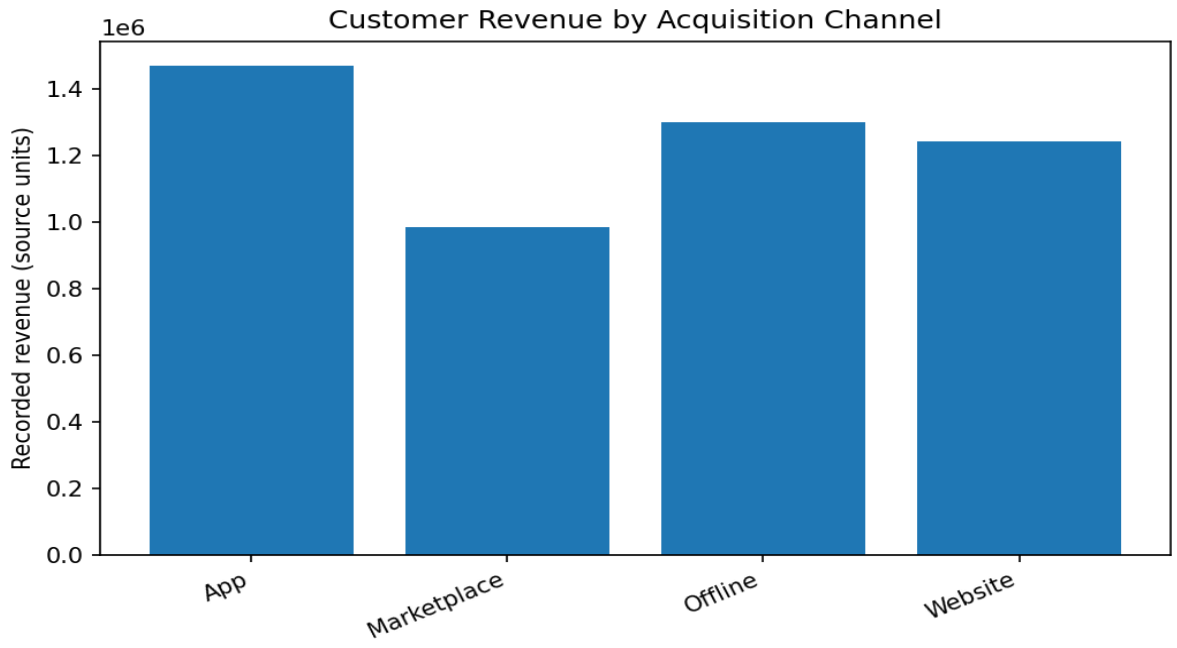

1. Executive KPI snapshot

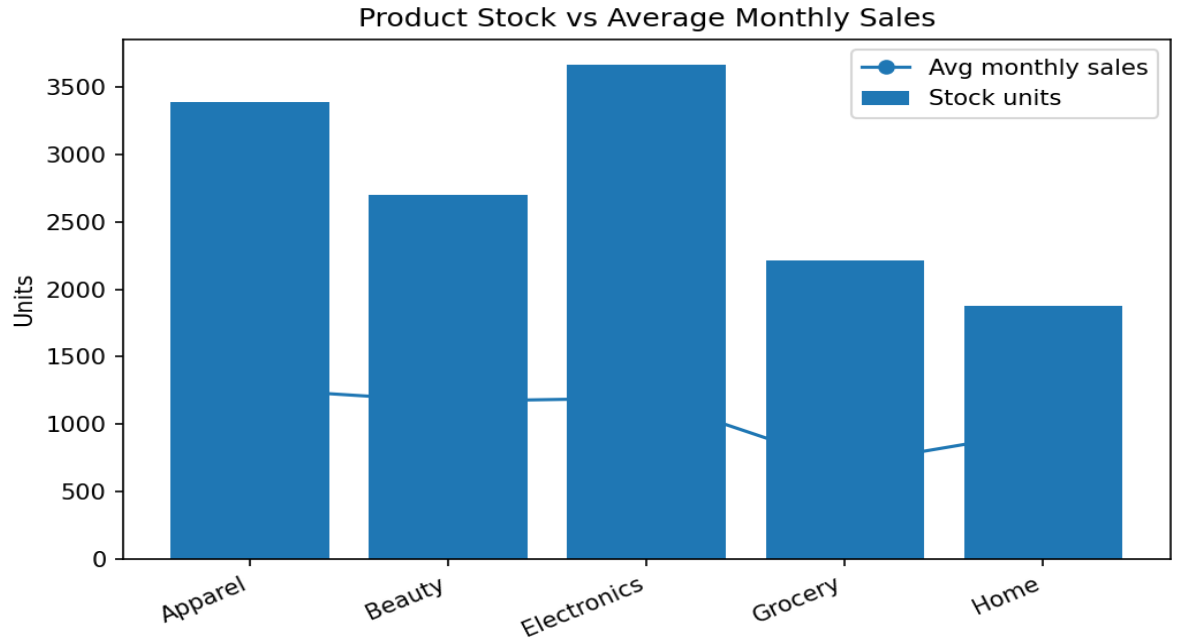

Domain	KPI	Result
Real estate	Listings / sold / sold rate	600 / 209 / 34.83%
Real estate	Median price / average days on market	172.595 lakh / 183.7 days
Customers	Customers / total orders	200 / 2,307
Customers	Recorded revenue / churn rate	4,992,621 source units / 3.00%
Products	Products / total stock units	50 / 13,857
Products	Avg. gross margin / stock-risk products	58.62% / 5

2. Dashboard v1 contents

The interactive HTML dashboard includes nine KPI cards and six charts: sold rate by city, median listing price by city, customer revenue by acquisition channel, customer churn split, stock versus average monthly sales by product category, and average gross margin by category. Supporting CSV outputs provide KPI definitions and drill-down aggregates.

3. Heuristic review

Review integrity: The included review log is an illustrative sample, not an actual peer review. It provides a checklist and sample observations to guide the real review. Enter the actual peer's name, date, comments, and evidence after sharing the dashboard with one peer.

Area	Sample finding	Priority
KPI clarity	Confirm customer revenue unit and define key rates.	High
Data context	Add a confirmed source refresh date.	Medium
Interpretation	Keep domain datasets separate; no shared key is supplied.	High
Visual accessibility	Check contrast, labels, and mobile layout.	Medium
Inventory action	Show the five products with stock below monthly sales.	High

4. Prioritized revision list

• High — Confirm currency/unit for Total_Revenue; retain source units until confirmed.

• Medium — Add source refresh/as-of date when available.

• Medium — Add concise KPI definitions and improve number-format consistency.

• High — Add a product-level stock-risk table for the five at-risk products.

• Medium — Add context for city sold-rate comparisons, including listing and transaction mix.

• Medium — Test chart contrast, responsive behavior, and small-screen readability.

• High — Complete one real peer review and replace the illustrative review with actual feedback and evidence.

5. Limitations and assumptions

The three datasets have different grains and no confirmed shared join key; they are reported in separate dashboard sections. Customer revenue currency is unspecified. Gross margin is calculated at product level as (MRP – COGS) / MRP and averaged without weighting by sales. City comparisons are descriptive and may reflect differences in listing mix. No causal or predictive claims are made.

6. Submission checklist

■ Open dashboard_v1.html in a browser and confirm charts load (internet required for Plotly CDN).

■ Share the dashboard link/file with one actual peer.

■ Complete reviewer name, date, actual comments, and evidence in peer_heuristic_review_log.md.

■ Update revision_list.md based on actual peer feedback and mark each item status.
